

## Maraviroc tablets, film coated 13 Pharmaceuticals, LLC

### HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use MARAVIROC TABLETS safely and effectively. See full prescribing information for MARAVIROC TABLETS.

### MARAVIROC TABLETS, for oral use Initial U.S. Approval: 2007

**WARNING: HEPATOTOXICITY** See full prescribing information for complete boxed warning.

- Hepatotoxicity has been reported which may be preceded by severe rash or other features of a systemic allergic reaction (e.g., fever, eosinophilia, or elevated IgE).
- Immediately evaluate patients with signs or symptoms of hepatitis or allergic reaction (5.1).

**INDICATIONS AND USAGE**

Maraviroc is a CCR5 co-receptor antagonist indicated in combination with other antiretroviral agents for the treatment of only CCR5-tropic HIV-1 infection in adults and pediatric patients 2 years of age and older weighing at least 10 kg (1).

**Limitations of Use:**

- Not recommended in patients with dual/mixed- or CXCR4-tropic HIV-1 (1).

**DOSE AND ADMINISTRATION**

- Prior to initiation of Maraviroc for treatment of HIV-1 infection, test all patients for CCR5 tropism using a highly sensitive tropism assay (2,1).
- Maraviroc tablets are given twice daily by mouth and may be taken with or without food. Maraviroc must be given in combination with other antiretroviral medications (2,2).

### Recommended Dosage in Adult Patients (2,3)

Concomitant Medications	Dosage of Maraviroc
When given with potent cytochrome P450 (CYP3A) inhibitors (with or without potent CYP3A inducers) including PIs (except tipranavir/ritonavir) (2,3, 2.1, 7.1)	150 mg twice daily
With NRTIs, nevirapine/ritonavir, efavirenz, and other drugs that are not potent CYP3A inhibitors or CYP3A inducers	300 mg twice daily
With potent and moderate CYP3A inducers including efavirenz (without a potent CYP3A inhibitor) (2,3, 7.1)	600 mg twice daily

A more complete list of coadministered drugs is listed in Dosage and Administration (2). Recommended Dosage in Pediatric Patients 2 years and older and weighing at Least 10 kg: Administer twice daily. Dosage should be based on body weight (kg) and concomitant medications and should not exceed the recommended adult dose (2,4).

**DOSE FORMS AND STRENGTHS**

- Tablets: 150 mg and 300 mg (3)

**CONTRAINDICATIONS**

Maraviroc is contraindicated in patients with severe renal impairment or end-stage renal disease (ESRD) (creatinine clearance [CrCl] less than 30 mL per minute), who are concomitantly taking potent CYP3A inhibitors or inducers (4).

**WARNINGS AND PRECAUTIONS**

1. **Hepatotoxicity**  
Severe Skin and Hypersensitivity Reactions  
Cardiovascular Events  
Immune Reconstitution Syndrome  
Potential Risk of Infection  
Severe Sinus and Hypersensitivity Reactions  
2. **ADVERSE REACTIONS**  
Clinical Trials Experience  
Postmarketing Experience

### FULL PRESCRIBING INFORMATION

**INDICATIONS AND USAGE**

2. **DOSE AND ADMINISTRATION**

2.1 Testing prior to Initiation of Maraviroc  
2.2 General Dosing Recommendations  
2.3 Recommended Dosage in Adult Patients with Normal Renal Function  
2.4 Recommended Dosage in Pediatric Patients with Normal Renal Function

2.5 Recommended Dosage in Patients with Renal Impairment

3. **DOSE FORMS AND STRENGTHS**

4. **CONTRAINDICATIONS**

5. **WARNINGS AND PRECAUTIONS**

5.1 Hepatotoxicity  
5.2 Severe Sinus and Hypersensitivity Reactions  
5.3 Cardiovascular Events  
5.4 Immune Reconstitution Syndrome  
5.5 Potential Risk of Infection  
5.6 Potential Risk of Malignancy

6. **ADVERSE REACTIONS**

6.1 Clinical Trials Experience  
6.2 Postmarketing Experience

**WARNING: HEPATOTOXICITY**  
Hepatotoxicity has been reported with use of Maraviroc. Severe rash or evidence of a systemic allergic reaction (e.g., fever, eosinophilia, or elevated IgE) prior to the development of hepatotoxicity may occur. Patients with signs or symptoms of hepatitis or allergic reaction following use of Maraviroc should be evaluated immediately (see Warnings and Precautions (5.1)).

### INDICATIONS AND USAGE

Maraviroc is indicated in combination with other antiretroviral agents for the treatment of only CCR5-tropic human immunodeficiency virus type 1 (HIV-1) infection in adult and pediatric patients 2 years of age and older weighing at least 10 kg.

**Limitations of Use:**

- Maraviroc is not recommended in patients with dual/mixed- or CXCR4-tropic HIV-1 (see Microbiology (12.4)).

### 2 DOSE AND ADMINISTRATION

2.1 Testing prior to Initiation of Maraviroc  
Prior to initiation of Maraviroc for treatment of HIV-1 infection, test all patients for CCR5 tropism using a highly sensitive tropism assay. Maraviroc is recommended for patients with only CCR5-tropic HIV-1 infection. Outgrowth of pre-existing low-level CXCR4- or dual/mixed-tropic HIV-1 not detected by tropism testing at screening has been associated with virologic failure on Maraviroc (see Microbiology (12.4), Clinical Studies (14.1)).

Monitor patients for alanine aminotransferase (ALT), aspartate aminotransferase (AST), and bilirubin prior to initiation of Maraviroc and at other time points during treatment as clinically indicated (see Warnings and Precautions (5.1)).

**WARNINGS AND PRECAUTIONS**

- Hepatotoxicity accompanied by severe rash or systemic allergic reaction, including potentially life-threatening events, has been reported. Hepatic laboratory parameters including alanine aminotransferase (ALT), aspartate aminotransferase (AST), and bilirubin should be obtained prior to starting Maraviroc and at other time points during treatment as clinically indicated. If rash or symptoms or signs of hepatitis or allergic reaction develop, hepatic laboratory parameters should be monitored and continuation of treatment should be considered. When administering Maraviroc to patients with pre-existing liver dysfunction or who are co-infected with hepatitis B and/or C virus, additional monitoring may be warranted (5.1).
- Severe and potentially life-threatening skin and hypersensitivity reactions have been reported in patients taking Maraviroc. This includes cases of Stevens-Johnson syndrome, hypersensitivity reaction, and toxic epidermal necrolysis. Immediately discontinue Maraviroc and other suspected agents if signs or symptoms of severe skin or hypersensitivity reactions develop or worsen. Patients who experience postural hypotension, the dose of Maraviroc should be reduced from 300 mg twice daily to 150 mg twice daily (5.3).
- More cardiovascular events, including myocardial ischemia and infarction, were observed in treatment-experienced subjects who received Maraviroc. Additional monitoring may be warranted. (5.3)
- If patients with severe renal impairment or ESRD received Maraviroc (without antiretroviral agents) for the treatment of HIV-1 infection, test all patients for CCR5 tropism using a highly sensitive tropism assay (2,1).
- Maraviroc tablets are given twice daily by mouth and may be taken with or without food. Maraviroc must be given in combination with other antiretroviral medications (2,2).

**ADVERSE REACTIONS**

- The most common adverse events in treatment-experienced adult subjects (greater than 8% incidence) which occurred at a higher frequency compared with placebo are upper respiratory tract infections, cough, rash, and dizziness (6.1).
- The most common adverse events in treatment-naïve adult subjects (greater than 8% incidence) which occurred at a higher frequency than the comparator are upper respiratory tract infections, bronchitis, flatulence, bloating and distention, upper respiratory tract infections, cough, rash, and dizziness (6.1).
- The most common adverse events in treatment-experienced pediatric subjects (greater than or equal to 3% incidence) are upper respiratory tract infections, cough, rash, and dizziness (6.1).

**ADVERSE REACTIONS**

- The most common adverse events in treatment-naïve adult subjects (greater than 8% incidence) which occurred at a higher frequency compared with placebo are upper respiratory tract infections, cough, rash, and dizziness (6.1).
- The most common adverse events in treatment-experienced pediatric subjects (greater than or equal to 3% incidence) are upper respiratory tract infections, cough, rash, and dizziness (6.1).

**ADVERSE REACTIONS**

- The most common adverse events in treatment-naïve adult subjects (greater than 8% incidence) which occurred at a higher frequency compared with placebo are upper respiratory tract infections, cough, rash, and dizziness (6.1).
- The most common adverse events in treatment-experienced pediatric subjects (greater than or equal to 3% incidence) are upper respiratory tract infections, cough, rash, and dizziness (6.1).

**ADVERSE REACTIONS**

- The most common adverse events in treatment-naïve adult subjects (greater than 8% incidence) which occurred at a higher frequency compared with placebo are upper respiratory tract infections, cough, rash, and dizziness (6.1).
- The most common adverse events in treatment-experienced pediatric subjects (greater than or equal to 3% incidence) are upper respiratory tract infections, cough, rash, and dizziness (6.1).

### Report Suspected Adverse Reactions, Contact 1-844-474-7353 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch

### DRUG INTERACTIONS

Concomitant administration with CYP3A inhibitors (except tipranavir/ritonavir), will increase the concentration of Maraviroc (7.1).

Concomitant administration with CYP3A inducers, including efavirenz, may decrease the concentration of Maraviroc (7.1).

Concomitant administration with St. John's wort is not recommended (7.1).

**USE IN SPECIFIC POPULATIONS**

- Lactation: Women infected with HIV should be instructed not to breastfeed due to the potential for HIV transmission (8.2).

### HOW TO USE MARAVIROC TABLETS

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### RECOMMENDED DOSAGE IN PATIENTS WITH RENAL IMPAIRMENT

Administer the oral solution using the appropriate oral dosing syringe; for doses greater than 2.5 mL, use the 10-mL syringe.

### 2.2 General Dosing Recommendations

Maraviroc tablets are taken twice daily by mouth and may be taken with or without food.

Maraviroc must be given in combination with other antiretroviral medications.

The recommended dosage of Maraviroc differs based on concomitant medications due to drug interactions.

### 2.3 Recommended Dosage in Adult Patients with Normal Renal Function

Table 1 displays oral dosage of Maraviroc based on different concomitant medications (see Drug Interactions (7.1)).

### Table 1. Recommended Dosage in Adults

Concomitant Medications	Dosage of Maraviroc
Potent cytochrome P450 (CYP3A) inhibitors (with or without a potent CYP3A inducer)*	150 mg twice daily
Noninteracting concomitant medications*	300 mg twice daily
Potent and moderate CYP3A inducers (without a potent CYP3A inhibitor)†	600 mg twice daily

\*Potent CYP3A inhibitors (with or without a potent CYP3A inducer) including: clarithromycin, cobicistat, efavirenz/ritonavir, itraconazole, ketoconazole, nefazodone, protease inhibitors (except tipranavir/ritonavir), telithromycin.

†Potent and moderate CYP3A inducers (without a potent CYP3A inhibitor) including: carbamazepine, efavirenz, etravirine, phenobarbital, phenytoin, and rifampin.

### 2.4 Recommended Dosage in Pediatric Patients with Normal Renal Function

The recommended dosage of Maraviroc should be based on body weight (kg) and should not exceed the recommended adult dose. The recommended dosage also differs based on concomitant medications due to drug interactions (Table 2 and Table 3) (see Drug Interactions (7.1)).

Before prescribing Maraviroc tablets, assess children for the ability to swallow tablets. If a child is unable to reliably swallow Maraviroc tablets, the oral solution formulation should be prescribed.

The recommended oral dosage of Maraviroc tablets in pediatric patients aged 2 years and older weighing at least 10 kg is presented in Table 2.

### Table 2. Recommended Dosage in Pediatric Patients Age 2 Years and Older Weighing at Least 10 kg (Tablets)

Concomitant Medications	Dosage of Maraviroc Based on Weight				
	10 kg to <14 kg	14 kg to <20 kg	>20 kg to <30 kg	30 kg to <40 kg	≥40 kg
Potent CYP3A inhibitors (with or without a potent CYP3A inducer)*	50 mg twice daily	50 mg twice daily	75 mg twice daily	100 mg twice daily	150 mg twice daily
Noninteracting concomitant medications†	150 mg twice daily	200 mg twice daily	200 mg twice daily	300 mg twice daily	300 mg twice daily

\*Potent CYP3A inhibitors (with or without a CYP3A inducer) including: clarithromycin, cobicistat, efavirenz/ritonavir, itraconazole, ketoconazole, nefazodone, protease inhibitors (except tipranavir/ritonavir), telithromycin.

†Noninteracting concomitant medications include all medications that are not potent CYP3A inhibitors or inducers such as: dolutegravir, enfuvirtide, nevirapine, all NRTIs, raltegravir, and tipranavir/ritonavir.

\*Potent and moderate CYP3A inducers (without a potent CYP3A inhibitor) including: carbamazepine, efavirenz, etravirine, phenobarbital, phenytoin, and rifampin.

†Insufficient data are available to recommend use.

The recommended oral dosage of Maraviroc oral solution in pediatric patients weighing at least 10 kg is presented in Table 3.

### Table 3. Recommended Dosage in Pediatric Patients Weighing at Least 10 kg (Oral Solution)

Concomitant Medications	Dosage (Volume of Solution) of Maraviroc Based on Weight				
	10 kg to <14 kg	14 kg to <20 kg	>20 kg to <30 kg	30 kg to <40 kg	≥40 kg
Potent CYP3A inhibitors (with or without a potent CYP3A inducer)*	50 mg (2.5 mL) twice daily	50 mg (2.5 mL) twice daily	80 mg (4 mL) twice daily	100 mg (5 mL) twice daily	150 mg (7.5 mL) twice daily
Noninteracting concomitant medications†	150 mg twice daily	200 mg twice daily	200 mg twice daily	300 mg twice daily	300 mg twice daily

\*Potent CYP3A inhibitors (with or without a CYP3A inducer) including: clarithromycin, cobicistat, efavirenz/ritonavir, itraconazole, ketoconazole, nefazodone, protease inhibitors (except tipranavir/ritonavir), telithromycin.

†Noninteracting concomitant medications include all medications that are not potent CYP3A inhibitors or inducers such as: dolutegravir, enfuvirtide, nevirapine, all NRTIs, raltegravir, and tipranavir/ritonavir.

\*Potent and moderate CYP3A inducers (without a potent CYP3A inhibitor) including: carbamazepine, efavirenz, etravirine, phenobarbital, phenytoin, and rifampin.

†Insufficient data are available to recommend use.

The recommended oral dosage of Maraviroc oral solution in pediatric patients weighing at least 10 kg is presented in Table 3.

### Table 3. Recommended Dosage in Pediatric Patients Weighing at Least 10 kg (Oral Solution)

Concomitant Medications	Dosage (Volume of Solution) of Maraviroc Based on Weight				
	10 kg to <14 kg	14 kg to <20 kg	>20 kg to <30 kg	30 kg to <40 kg	≥40 kg
Potent CYP3A inhibitors (with or without a potent CYP3A inducer)*	50 mg (2.5 mL) twice daily	50 mg (2.5 mL) twice daily	80 mg (4 mL) twice daily	100 mg (5 mL) twice daily	150 mg (7.5 mL) twice daily
Noninteracting concomitant medications†	150 mg twice daily	200 mg twice daily	200 mg twice daily	300 mg twice daily	300 mg twice daily

\*Potent CYP3A inhibitors (with or without a CYP3A inducer) including: clarithromycin, cobicistat, efavirenz/ritonavir, itraconazole, ketoconazole, nefazodone, protease inhibitors (except tipranavir/ritonavir), telithromycin.

†Noninteracting concomitant medications include all medications that are not potent CYP3A inhibitors or inducers such as: dolutegravir, enfuvirtide, nevirapine, all NRTIs, raltegravir, and tipranavir/ritonavir.

\*Potent and moderate CYP3A inducers (without a potent CYP3A inhibitor) including: carbamazepine, efavirenz, etravirine, phenobarbital, phenytoin, and rifampin.

†Insufficient data are available to recommend use.

### 3 DOSE FORMS AND STRENGTHS

150-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

300-mg blue, oval, film-coated tablets, debossed "13" on one side and "23" on the other side.

## 12.2 Pharmacodynamics

### Exposure-Response Relationship in Treatment-Experienced Adult Subjects

The relationship between maraviroc, modeled plasma trough concentration ( $C_{min}$ ) (1 to 9 samples per subject taken on up to 7 visits), and virologic response was evaluated in 973 treatment-experienced HIV-1-infected subjects with various optimized background antiretroviral regimens in Trials AA001027 and AA001028. The  $C_{min}$  baseline viral load, baseline CD4+ cell count, and overall sensitivity score (OSS) were found to be important predictors of virologic success (defined as viral load less than 400 copies per mL at 24 weeks). Table 9 illustrates the proportions of subjects with virologic success (%) within each  $C_{min}$  quartile for 150-mg twice-daily and 300-mg twice-daily groups.

	150 mg Twice Daily (with CYP3A Inhibitors)		300 mg Twice Daily (without CYP3A Inhibitors)			
	n	% Subjects with Virologic Success	n	% Subjects with Virologic Success		
Placebo	160	-	30.6	35	-	28.6
Q1	78	33	52.6	22	13	50.0
Q2	77	87	63.6	22	29	68.2
Q3	78	166	78.2	22	46	63.6
Q4	78	279	74.4	22	97	68.2

### Exposure-Response Relationship in Treatment-Naïve Adult Subjects

The relationship between maraviroc, modeled plasma trough concentration ( $C_{min}$ ) (1 to 12 samples per subject taken on up to 8 visits), and virologic response was evaluated in 294 treatment-naïve HIV-1-infected subjects receiving maraviroc 300 mg twice daily in combination with lamivudine/zidovudine in Trial AA001026. Table 10 illustrates the proportion (%) of subjects with virologic success less than 50 copies per mL at 48 weeks within each  $C_{min}$  quartile for the 300-mg twice-daily dose.

	300 mg Twice Daily		
	n	% Subjects with Virologic Success	
Q1	75	23	57.3
Q2	72	39	72.2
Q3	73	56	74.0
Q4	74	81	83.8

Eighteen of 74 (24%) subjects in Q1 had no measurable maraviroc concentration on at least one occasion versus 1 of 73 and 1 of 1 and 74 in Q3 and Q4, respectively.

### Effects on Electrocardiogram

A placebo-controlled, randomized, crossover trial to evaluate the effect on the QT interval of healthy male and female volunteers was conducted with 3 single oral doses of maraviroc and moxifloxacin. The placebo-adjusted mean maximum (upper  $\pm$ 1-sided 95% CI) increases in QTc from baseline after 100, 300, and 600 mg of maraviroc were 2.0 (0.1), 4.1 (1.1), and 5.1 (1.5) msec, respectively, and 13 (15) msec for moxifloxacin 400 mg. No subject in any group had an increase in QTc of greater than or equal to 60 msec from baseline. No subject experienced an increase exceeding the potentially clinically relevant threshold of 500 msec.

## 12.3 Pharmacokinetics

Table 11. Mean Maraviroc Pharmacokinetic Parameters in Adults

Patent Population (Phase 1)	Maraviroc Dose	n	AUC <sub>0-24</sub> (ng·h/mL)	C <sub>max</sub> (ng/mL)	C <sub>min</sub> (ng/mL)
Healthy volunteers (Phase 1)	300 mg twice daily	64	2,908	888	43.1
Asymptomatic HIV subjects (Phase 2a)	300 mg twice daily	8	2,550	618	33.6
Treatment-experienced HIV subjects (Phase 3)*	300 mg twice daily	94	1,513	266	37.2
	150 mg twice daily (+ CYP3A inhibitor)	375	2,463	332	101
Treatment-naïve HIV subjects (Phase 2b)†	300 mg twice daily	344	1,865	287	60

\* The estimated exposure is lower compared with other trials possibly due to sparse sampling, food effect, compliance, and concomitant medications.

### Absorption

Maraviroc plasma concentrations are attained 0.5 to 4 hours following single oral doses of 1 to 1,200 mg administered to uninfected volunteers. The pharmacokinetics of oral maraviroc are not dose proportional over the dose range.

The absolute bioavailability of a 100-mg dose is 23% and is predicted to be 33% at 300 mg. Maraviroc is a substrate for the efflux transporter P-gp.

**Effect of Food on Oral Absorption:** Coadministration of a 300-mg tablet with a high-fat breakfast reduced maraviroc  $C_{max}$  and AUC by 33% and coadministration of 75 mg of oral solution with a high-fat breakfast reduced maraviroc AUC by 73% in healthy adult volunteers. Studies with the tablet formulation demonstrated a reduced food effect at higher doses.

There were no food restrictions in the adult trials (using the tablet formulation) or in the pediatric trial (using both tablet and oral solution formulations) that demonstrated the efficacy/safety/antiviral activity and safety of maraviroc [see Clinical Studies (14.1, 14.2)].

### Distribution

Maraviroc is bound (approximately 76%) to human plasma proteins, and shows moderate affinity for albumin and alpha-1 acid glycoprotein. The volume of distribution of maraviroc is approximately 194 L.

### Elimination

**Metabolism:** Trials in humans and in vitro studies using human liver microsomes and expressed enzymes have demonstrated that maraviroc is principally metabolized by the cytochrome P450 system to metabolites that are essentially inactive against HIV-1. In vitro studies indicate that CYP3A is the major enzyme responsible for maraviroc metabolism. In vitro studies also indicate that polymorphic enzymes CYP2C8, CYP2C6, and CYP2C19 do not contribute significantly to the metabolism of maraviroc.

Maraviroc is the major circulating component (~42% drug-related radioactivity) following a single oral dose of 300 mg [<sup>14</sup>C]-maraviroc. The most significant circulating metabolite in humans is a secondary amine (~22% radioactivity) formed by N-dealkylation. This polar metabolite has no significant pharmacological activity. Other metabolites are products of mono-oxidation and are only minor components of plasma drug-related radioactivity.

**Excretion:** The terminal half-life of maraviroc following oral dosing to steady state in healthy subjects was 14 to 18 hours. A mass balance/excretion trial was conducted using a single 300-mg dose of <sup>14</sup>C-labeled maraviroc. Approximately 20% of the radiolabel was recovered in the urine and 70% was recovered in the feces over 168 hours. Maraviroc was the major component present in urine (mean of 8% dose) and feces (mean of 25% dose). The remainder was excreted as metabolites.

### Specific Populations

**Patients with Hepatic Impairment:** Maraviroc is primarily metabolized and eliminated by the liver. A trial compared the pharmacokinetics of a single 300-mg dose of maraviroc in subjects with mild (Child-Pugh Class A, n = 8) and moderate (Child-Pugh Class B, n = 8) hepatic impairment with pharmacokinetics in healthy subjects (n = 8). The mean  $C_{max}$  and AUC were 11% and 25% higher, respectively, for subjects with mild hepatic impairment, and 32% and 46% higher, respectively, for subjects with moderate hepatic impairment compared with subjects with normal hepatic function. These changes do not warrant a dose adjustment. Maraviroc concentrations are higher when Maraviroc, 150 mg is administered with a potent CYP3A inhibitor compared with following administration of 300 mg without a CYP3A inhibitor, so patients with moderate hepatic impairment who receive Maraviroc, 150 mg with a potent CYP3A inhibitor should be monitored closely for maraviroc-associated adverse events. The pharmacokinetics of maraviroc have not been studied in subjects with severe hepatic impairment [see Warnings and Precautions (5.1)].

**Patients with Renal Impairment:** A trial compared the pharmacokinetics of a single 300-mg dose of Maraviroc in adult subjects with severe renal impairment (CrCl less than 30 mL per minute, n = 6) and ESRD (n = 6) with healthy volunteers (n = 6). Geometric mean ratios for maraviroc  $C_{max}$  and AUC<sub>0-24</sub> were 2.4-fold and 3.2-fold higher, respectively, for subjects with severe renal impairment, and 1.7-fold and 2.0-fold higher, respectively, for subjects with ESRD as compared with subjects with normal renal function in this trial. Hemodialysis had a minimal effect on maraviroc clearance and exposure in subjects with ESRD. Exposures observed in subjects with severe renal impairment and ESRD were within the range observed in previous 300-mg single-dose trials of Maraviroc in healthy volunteers with normal renal function. However, maraviroc exposures in the subjects with normal renal function in this trial were 50% lower than those observed in previous trials. Based on the results of this trial, no dose adjustment is recommended for patients with renal impairment receiving Maraviroc without a potent CYP3A inhibitor or inducer. However, if patients with severe renal impairment or ESRD experience any symptoms of postural hypotension while taking Maraviroc, 300 mg twice daily, their dose should be reduced to 150 mg twice daily [see Dosage and Administration (2.3)].

### Warnings and Precautions (5.1)

In addition, the trial compared the pharmacokinetics of multiple-dose Maraviroc in combination with saquinavir/ritonavir 1,000/100 mg twice daily (a potent CYP3A inhibitor combination) for 7 days in subjects with mild renal impairment (CrCl greater than 50 and less than or equal to 60 mL per minute, n = 6) and moderate renal impairment (CrCl greater than or equal to 30 and less than or equal to 50 mL per minute, n = 6) with healthy volunteers with normal renal function (n = 6). Subjects received 150 mg of Maraviroc at different dose frequencies (healthy volunteers = every 12 hours; mild renal impairment = every 24 hours; moderate renal impairment = every 48 hours). Compared with healthy volunteers (dosed every 12 hours), geometric mean ratios for maraviroc AUC<sub>0-24</sub>,  $C_{max}$ , and  $C_{min}$  were 50% higher, 20% higher, and 43% lower, respectively, for subjects with mild renal impairment (dosed every 24 hours). Geometric mean ratios for maraviroc AUC<sub>0-24</sub>,  $C_{max}$ , and  $C_{min}$  were 15% higher, 29% lower, and 85% lower, respectively, for subjects with moderate renal impairment (dosed every 48 hours) compared with healthy volunteers (dosed every 12 hours). Based on the data from this trial, adjustment in dose is recommended for patients with mild or moderate renal impairment [see Dosage and Administration (2.3)].

**Pediatric Patients: Aged 2 to Less Than 18 Years.** The pharmacokinetics of maraviroc were evaluated in CRS-tropic, HIV-1-infected, treatment-experienced pediatric subjects aged 2 to less than 18 years. In the dose-finding study of Trial AA001031, doses were administered with food on intensive pharmacokinetic evaluation days and optimized to achieve an average concentration over the dosing interval ( $C_{avg}$ ) of greater than 100 ng per mL throughout the trial, on non-intensive pharmacokinetic evaluation days maraviroc was taken with or without food. The initial dose of maraviroc was based on the concomitant medication category (i.e., presence of CYP3A inhibitors and/or inducers). The conversion of dosing to a weight (kg)-band basis in children provides comparable exposures with those observed in the trial at the corresponding BSA.

Maraviroc pharmacokinetic parameters in pediatric subjects aged 2 to less than 18 years receiving potent CYP3A inhibitors with or without a potent CYP3A inducer were similar to those observed in adults (Table 12).

Table 12. Maraviroc Pharmacokinetic Parameters in Treatment-Experienced Pediatric Patients Receiving Maraviroc with Potent CYP3A Inhibitors (with or without a Potent CYP3A Inducer)

	Weight	Maraviroc Pharmacokinetic Parameter* Geometric Mean			
		AUC <sub>0-24</sub> (ng·h/mL)	$C_{max}$ (ng/mL)	$C_{min}$ (ng/mL)	$C_{min}$ (ng/mL)
10 to <20 kg	50 mg twice daily	2,349	196	324	78
20 kg to <30 kg	75 mg twice daily	3,020	252	394	118
>30 kg to <40 kg	100 mg twice daily	3,229	269	430	126
>40 kg	150 mg twice daily	4,044	337	563	152

\* Model-predicted steady-state pharmacokinetic parameters are presented.

Clinical pharmacokinetic data in pediatric patients aged 2 to less than 18 years receiving noninteracting concomitant medications are limited. Based on population pharmacokinetic modeling and simulation, the recommended dosing regimen of Maraviroc for this population is based on baseline viral load, baseline CD4+ cell count, and overall sensitivity score (OSS) in adults receiving Maraviroc, 300 mg twice daily (with noninteracting concomitant medications) [see Dosage and Administration (2.4)].

**Geriatric Patients:** Pharmacokinetics of maraviroc have not been fully evaluated in the elderly (aged 65 years and older). Based on population pharmacokinetic analyses, age did not have a clinically relevant effect on maraviroc exposure in subjects up to age 65 years [see Use in Specific Populations (8.5)].

**Race and Gender:** Based on population pharmacokinetics and 2 clinical CYP3A5 genotype analyses for race, no dosage adjustment is recommended based on race or gender.

### Drug Interactions Studies

**Effect of Concomitant Drugs on the Pharmacokinetics of Maraviroc:** Maraviroc is a substrate of CYP3A and P-gp and hence its pharmacokinetics are likely to be modulated by inhibitors and inducers of these enzymes/transporters. The CYP3A/P-gp inhibitors ritonavir, lopinavir/ritonavir, ritonavir, darunavir/ritonavir, saquinavir/ritonavir, and atazanavir/ritonavir all increased the  $C_{max}$  and AUC of maraviroc (Table 14). The CYP3A and/or P-gp inducers rifampin, efavirenz, and efavirenz decreased the  $C_{max}$  and AUC of maraviroc (Table 14). While not studied, potent CYP3A and/or P-gp inducers carbamazepine, phenobarbital, and phenytoin are expected to decrease maraviroc concentrations. Based on in vitro studies, maraviroc is also a substrate of OATP1B1 and MRP2, so pharmacokinetics may be modulated by inhibitors of these transporters.

Tipranavir/ritonavir (net CYP3A inhibitor/P-gp inducer) did not affect the steady-state pharmacokinetics of maraviroc (Table 14). Cotrimoxazole and tenofovir did not affect the pharmacokinetics of maraviroc.

Table 14. Effect of Coadministered Agents on the Pharmacokinetics of Maraviroc

Coadministered Drug and Dose	n	Dose of Maraviroc	Ratio (90% CI) of Maraviroc Pharmacokinetic Parameters with/without Coadministered Drug (No Effect = 1.00)

\* Compared with historical data.

**Effect of Maraviroc on the Pharmacokinetics of Concomitant Drugs:** Maraviroc is unlikely to inhibit the metabolism of coadministered drugs metabolized by the following cytochrome P enzymes (CYP1A2, CYP2B6, CYP2C8, CYP2C9, CYP2C19, and CYP3A) or to inhibit the uptake of OATP1B1 or the export of MRP2 because maraviroc did not inhibit activity of these enzymes or transporters at clinically relevant concentrations in vitro. Maraviroc does not induce CYP1A2 in vitro. Additionally, in vitro studies have shown that maraviroc is not a substrate for, and does not inhibit, any of the major renal uptake inhibitors (organic anion transporter [OAT1], OAT3, organic cation transporter [OCT2], novel organic cation transporter [OCTN1], and OCTN2) at clinically relevant concentrations.

In vitro results suggest that maraviroc could inhibit P-gp in the gut. However, maraviroc did not significantly affect the pharmacokinetics of digoxin in vivo, indicating maraviroc may not significantly inhibit or induce P-gp clinically.

Drug interaction trials were performed with maraviroc and other drugs likely to be coadministered or commonly used as probes for pharmacokinetic interactions (Table 14).

Coadministration of fosamprenavir 1,400 mg/ritonavir 100 mg twice daily and maraviroc 300 mg twice daily decreased the  $C_{max}$  and AUC of amprenavir by 35% and 35%, respectively. Coadministration of fosamprenavir 1,400 mg/ritonavir 100 mg once daily and maraviroc 300 mg once daily decreased the  $C_{max}$  and AUC of amprenavir by 15% and 30%, respectively. No dosage adjustment is necessary when Maraviroc is dosed 150 mg twice daily in combination with fosamprenavir/ritonavir 1,400 mg/100 mg once daily. Fosamprenavir should be given with ritonavir when coadministered with maraviroc. Maraviroc had no significant effect on the pharmacokinetics of efavirenz, zidovudine, or lamivudine. Maraviroc decreased the C<sub>min</sub> and AUC of ritonavir by 27% and 37%, respectively, which is not clinically significant. Maraviroc had no clinically relevant effect on the pharmacokinetics of midazolam, the oral coxibs etoricoxib and levomegestrol, no effect on the urinary 6 $\beta$ -hydroxycortisol/cortisol ratio, suggesting no induction of CYP3A in vivo. Maraviroc had no effect on the dibenzoyne metabolic ratio (MR) at 300 mg twice daily or less in vivo and no effect on the dibenzoyne metabolic ratio (MR) at 300 mg twice daily or less in vitro. Maraviroc had no effect on the dibenzoyne metabolic ratio (MR) at 300 mg twice daily or less in vitro. However, there was 234% increase in dibenzoyne MR on treatment compared with baseline at 600 mg once daily, suggesting potential inhibition of CYP2D6 at higher doses.

### 12.4 Microbiology

#### Mechanism of Action

Maraviroc is a member of a therapeutic class called CCR5 co-receptor antagonists. Maraviroc selectively binds to the human chemokine receptor CCR5 present on the cell membrane, preventing the interaction of HIV-1 gp120 with CCR5 necessary for CCR5-tropic HIV-1 to enter cells. CXCR4-tropic and dual-tropic HIV-1 entry is not inhibited by maraviroc.

#### Antiviral Activity in Cell Culture

Maraviroc inhibits the replication of CCR5-tropic laboratory strains and primary isolates of HIV-1 in models of acute peripheral blood leukocyte infection. The mean EC50 value (50% effective concentration) for maraviroc against HIV-1 gp120 fusion inhibitor resistant to the existing recombinant form AE) and group D isolates ranged from 0.1 to 4.5 nM (0.05 to 2.3 ng per mL) in cell culture.

When used with other antiretroviral agents in cell culture, the combination of maraviroc was not antagonistic with non-nucleoside reverse transcriptase inhibitors (NNRTIs: efavirenz and nevirapine), NRTIs (abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir, zalcitabine, and zidovudine), or protease inhibitors (PIs: amprenavir, atazanavir, darunavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir, and tipranavir). Maraviroc was not antagonistic with the HIV-1 gp120 fusion inhibitor T-20. In cell culture, maraviroc was active against CXCR4-tropic and dual-tropic viruses (EC50 value greater than 10 micromM). The antiviral activity of maraviroc against HIV-2 has not been evaluated.

**Resistance in Cell Culture:** HIV-1 variants with reduced susceptibility to maraviroc have been selected in cell culture following serial passage of CCR5-tropic viruses (CR05 and RU570). The maraviroc-resistant viruses remained CCR5-tropic with no evidence of a change from a CCR5-tropic virus to a CXCR4-using virus. Two amino acid residue substitutions in the V3 loop region of the HIV-1 envelope glycoprotein (gp150), A316T, and I229V (HXB2 numbering), were shown to be necessary for the maraviroc-resistant phenotype in the HIV-1 isolate CR05. In the RU570 isolate a 3-amino acid residue deletion in the V3 loop,  $\Delta$ AI (HXB2 positions 315 to 317), was associated with maraviroc resistance. The relevance of the specific gp120 substitutions observed in maraviroc-resistant isolates selected in cell culture to clinical maraviroc resistance is not known. Maraviroc-resistant viruses were characterized phenotypically by concentration-response curves that did not reach 100% inhibition in phenotypic drug assays, rather than increases in EC<sub>50</sub> values.

**Cross-Resistance in Cell Culture:** Maraviroc had antiviral activity against HIV-1 clinical isolates resistant to NNRTIs, NRTIs, PIs, and the gp120 fusion inhibitor enfuvirtide in cell culture (EC50 values ranged from 0.7 to 8.9 nM [0.36 to 4.57 ng per mL]). Maraviroc-resistant viruses that emerged in cell culture remained susceptible to enfuvirtide and the protease inhibitor saquinavir.

**Clinical Resistance:** Virologic failure on maraviroc can result from genotypic and phenotypic resistance to maraviroc, through outgrowth of undetected CXCR4-using virus present before maraviroc treatment (see *Tropism below*), through resistance to background therapy drugs (Table 15), or due to low exposure to maraviroc [see Clinical Pharmacology (12.2)].

**Antiretroviral Treatment-Experienced Adult Subjects (Trials AA001027 and AA001028):** Week 48 data from treatment-experienced subjects failing maraviroc-containing regimens with CCR5-tropic virus (n = 58) have identified 22 viruses that had decreased susceptibility to maraviroc characterized by genotypic drug resistance by concentration-response curves that did not reach 100% inhibition. Additionally, CCR5-tropic virus from 2 of these treatment-failure subjects had greater than or equal to 3-fold shifts in EC50 values for maraviroc at the time of failure.

Fifteen of these viruses were sequenced in the gp120 encoding region and multiple amino acid substitutions with unique patterns in the heterogeneous V3 loop region were observed. Changes at either amino acid position 308 or 323 (HXB2 numbering) were seen in the V3 loop of 17 of the subjects with decreased maraviroc susceptibility. Substitutions outside the V3 loop of gp120 also contribute to reduced susceptibility to maraviroc.

**Antiretroviral Treatment-Naïve Adult Subjects (Trial AA001026):** Treatment-naïve subjects receiving Maraviroc had more virologic failures and more treatment-emergent resistance to the background regimen drugs compared with those receiving efavirenz (Table 15).

**Table 15. Development of Resistance to Maraviroc or Efavirenz and Background Drugs in Antiretroviral Treatment-Naïve Adult Subjects with HIV-1 CCR5-Tropic Virus at Screening Using Enhanced Sensitivity TROFILE Assay**

	Maraviroc	Efavirenz
Total N in dataset (as-treated)	273	241
Total virologic failures (as-treated)	85 (31%)	56 (23%)
Evaluable virologic failures with post baseline genotypic and phenotypic data	73	43
Lamivudine resistance	39 (53%)	13 (30%)
Zidovudine resistance	2 (3%)	0
Efavirenz resistance	-	23 (53%)
Phenotypic resistance to maraviroc*	19 (26%)	-

\* Includes subjects failing with CXCR4- or dual/mixed-tropism because these viruses are not intrinsically susceptible to maraviroc.

In an as-treated analysis of treatment-naïve subjects at 96 weeks, 32 subjects failed a maraviroc-containing regimen with CCR5-tropic virus and had a tropism result at failure; 7 of these subjects had evidence of maraviroc phenotypic resistance defined as concentration-response curves that did not reach 95% inhibition. One additional subject failed a regimen with or equal to a 3-fold shift in the EC<sub>50</sub> value for maraviroc at the time of failure. A clonal analysis of the V3 loop amino acid envelope sequences was performed from 6 of the 7 subjects. Changes in V3 loop amino acid sequence differed between each of these different subjects, even for those infected with the same virus clone, suggesting that there are multiple diverse pathways to maraviroc resistance. The subjects who failed with CCR5-tropic virus and without a detectable maraviroc shift in susceptibility were not evaluated for genotypic resistance.

Of the 32 maraviroc virologic failures failing with CCR5-tropic virus, 20 (62%) also had genotypic and/or phenotypic resistance to background drugs in the regimen (lamivudine, zidovudine).

**Tropism:** In both treatment-experienced and treatment-naïve subjects, detection of CXCR4-using virus prior to initiation of therapy has been associated with a reduced virologic response to maraviroc.

**Antiretroviral Treatment-Experienced Subjects (Trials AA001027 and AA001028):** In the majority of cases, treatment failure on maraviroc was associated with detection of CXCR4-using virus (i.e., CXCR4- or dual/mixed-tropic) which was not detected by the tropism assay prior to treatment. CXCR4-using virus was detected at failure in approximately 55% of subjects who failed treatment on maraviroc by Week 48, as compared with 9% of subjects who experienced treatment failure in the placebo arm. To investigate the likely origin of the on-treatment CXCR4-using virus, a detailed clonal analysis was conducted on 20 representative subjects (16 subjects from the maraviroc arms and 4 subjects from the placebo arm) in whom CXCR4-using virus was detected at treatment failure. From analysis of amino acid sequence differences and phylogenetic data, it was determined that CXCR4-using virus in these subjects emerged from a low level of pre-existing CXCR4-using virus not detected by the tropism assay (which has population-level prior to treatment rather than from a co-receptor switch from CCR5-tropic virus to CXCR4-using virus resulting from mutation in the virus).

Detection of CXCR4-using virus prior to initiation of therapy has been associated with a reduced virologic response to maraviroc. Furthermore, subjects failing twice-daily maraviroc at Week 48 with CXCR4-using virus had a lower median increase in CD4+ cell counts from baseline (+41 cells per mm<sup>3</sup>) than those subjects failing with CCR5-tropic virus (+162 cells per mm<sup>3</sup>). The median increase in CD4+ cell count in subjects failing in the placebo arm was +7 cells per mm<sup>3</sup>. **Antiretroviral Treatment-Naïve Subjects (Trial AA001026):** In a 96-week trial of antiretroviral treatment-naïve subjects, 14% (12 of 85) who had only CCR5-tropic virus at screening

with an enhanced sensitivity tropism assay (TROFILE) and failed therapy on maraviroc had CXCR4-using virus at the time of treatment failure. A detailed clonal analysis was conducted in
